10 reasons to upgrade to the latest Infor PLM for Fashion

The latest release of Infor PLM for Fashion offers new tools to help you plan, develop, comply, approve, and collaborate with partners in the design and pre-production process. In addition, the new Infor PLM for Fashion offers a multi-tenant solution built on the Infor® OS platform, which also leverages Infor ION® and Infor Ming.le® for seamless and social collaboration.

Here are ten reasons your company should upgrade to the latest version of Infor PLM for Fashion now:

1. Industry-leading user experience

All your teams—design, development, commercial, and suppliers—can become more productive in less time with Infor PLM for Fashion's intuitive user interface. Enjoy a task-oriented homepage and a host of smart features, including drag-and-drop capabilities, easy uploading, multi-select options, and image and attachment management. And, the application supports both Mac and PC.

2. Bi-directional Adobe® plugins

Your graphic designers, who live and breathe inside Adobe applications, won't lose their train of thought. Our bi-directional plugins now include an Adobe Illustrator plugin with secure access to PLM, and applicable development activities for styles, materials, and trims.

3. Intuitive planning and development

The latest version offers advanced capabilities for concurrent merchandise planning and product design. Easily create new styles or add current ones to an existing line plan.

4. Time-saving "mass" functionality

Instead of starting from scratch on every new style, your team can use details and attributes from existing ones. Eliminate manual data entry every time something changes in your supply chain, and increase efficiency with "mass" creation, updating, deletion, and more.

5. Easy sample order generation

Now you can generate and finalize sample orders right from Infor PLM for Fashion, so you can devote your time to more creative, proactive projects.

6. Get to market faster with 24/7 vendor collaboration

PLM in the cloud empowers you to share, develop, and collaborate across your entire supply chain in real time. Infor PLM for Fashion hosts a wide variety of functionalities for partners and suppliers, including enhanced collaboration features that are new to this version.

7. Graphical drilldown and critical path tracking

Managers, users, and partners get their own role-based dashboards with adjustable views and permissions. Dive deep into your calendars and down to specific styles to preempt delays in a timely manner.

8. Built-in analytics and reporting

Enjoy a lower total cost of ownership and get better insight into your business with advanced analytics and automated reports.

9. Improved compliance and approval workflows

Support for certain compliance and approval functions allows users to send requests for samples, cost quotations, lab-dips, and performance tests.

10. Flexible, agile cloud offering

Infor PLM for Fashion's flexible, advanced integration capabilities connect your systems from concept to consumer, and provide tools to support data migration from legacy systems. With new delivery as a cloud service subscription, Infor PLM for Fashion virtually eliminates the need for future additional hardware, local configuration, and support resources, since new innovations are delivered without the need for major upgrades. This can help save time-to-value and lower the overall cost of ownership.
